Introduction

To run this project, you will need Node.js and yarn installed. Both of them are fairly simple to install and use.

Firstly, you need Node.js, and it can be downloaded and installed through this link: https://nodejs.org/en. After installing, you can check your Node.js version by typing `node -v` on terminal.

Then, having Node.js installed, you can follow the instructions on how to install yarn here: https://classic.yarnpkg.com/en/docs/install#debian-stable. You are basically going to run the command `npm install --global yarn`. To check your yarn version later, you can just type `yarn --version` on the terminal.

I already have Node.js and yarn, how to proceed?

If you already have Node.js and yarn, that's great. The only thing you will need then is to get to the application folder and:

- Firstly, execute the command `yarn` on the terminal(inside the project folder). By doing this, all the packages are going to be automatically installed.
- Then, to run the app, run the command `yarn start`(Also inside the project folder). The app will then automatically start.
